

Hostile Material Review Board

Shell compile + install v2 skeleton (spec 0.1)

Repo: SimonBarnett/agentc_fomprep | **Date:** 2026-09-19 | **Machine:** ionos

Spec: docs/feature-request-shell-compile-install-v2-spec-0.1.md (+ PDF)

v1: src\Prepare-NamedForm.ps1 — no diff

Verdict: **PASS-with-nits** for the locked WP0 skeleton slice. **Not** ready for human UAT of live compile/install. Only Bob may declare ready for human UAT. This board does not.

1. What was locked

Until PinComplete: skeleton only — parser, allowlist, WhatIf, schemas, refuse paths, SKILL.md, WP0 fail-fast. No guessed procedure/ENAME names. Two separate skills/tools: `compile_shell` and `install_shell`. Do not rebuild fomprep or the catalog host. Red before WCF.

2. Blockers

None against the skeleton lock. These would be blockers if the push claimed WCF compile/install or `ok=true` compiled/installed:

- PinComplete is false; Prepare Upgrade / Install Upgrade ENAMES are empty.
- No WCF walker. Runners refuse with reason=pin_incomplete, wcfAttempted=false, exit 2.
- PRIORITY_WP0_INSTANCE unset on ionos; WP0-R1..R7 skipped.

3. Evidence (ionos)

Gate	Result
v2/tools/Test-WP0.ps1	exit 0; all WP0-T* PASS; R* skipped
tools/Test-Pack.ps1	PASS (WP0 first, then AT6, unit-*, AT3)
git diff src\Prepare-NamedForm.ps1	empty
v2/tests/wp0-last.json	failed=0, pinComplete=false

WP0-T8: unknown instance, live refuse, missing shell, DBI without flag, path . . , catalog/plugin fixtures live-install refuse, WhatIf exit 0. Refuse paths exit 2, errors[] non-empty, no WCF. WP0-T7: fixture 1042-sanitized.sh parses revision 1042 and codes TAKESINGLEENT, TAKEENTHEADER, TAKEPROCSTEP. WP0-T6: no hardcoded PREPAREUPGRADE / INSTALLUPGRADE / PREPUPG / INSTUPG in product runners or MCP servers.

4. Spec MUST / MUST NOT

Requirement	Status
v2 only; do not change repo-root src\Prepare-NamedForm.ps1	Met
Two catalog folders priority-shell-compile / priority-shell-install	Met
Two tools compile_shell / install_shell; never one combined tool	Met (sibling plugins; fomprep MCP untouched)
Do not rebuild fomprep or catalog MCP handlers	Met (mcp.ts and priority-fomprep plugin untouched)
Shared lib: allowlist, sql, cred, parse-sh	Met (v2/lib/ + portable copies)
Result JSON aligned with FormPrep v2	Met (ok, runId, instanceId, skill, executor, timestamps, reason, exitCode, errors[])

Requirement	Status
Until PinComplete: no guessed ENAMES / no WCF success path	Met
allow_dbi default false; DBI refuse before WCF	Met
Path allowlist: ..., foreign UNC, catalog fixtures	Met
Catalog MCP stays grab-only	Met
Red before WCF	Met

5. Required fixes (ordered) — next slice, not this skeleton

- 1 Human recon on a proof instance (PRIORITY_WP0_INSTANCE). Fill v2/config/pin.json and pin.psd1 from dictionary titles. Do not invent ENAMES. Flip PinComplete only after reading recon.
- 2 Implement WCF walk for Prepare Upgrade / Install Upgrade from pins only. File-step vs WINRUN is a pin (WcfFileStepWorks).
- 3 Install SQL gate from the pinned install-log table; every TAKESINGLEENT name must exist in T\$EXEC; postInstall.formsUnprepared[] handoff to prepare_form (do not auto-prep).
- 4 Re-run WP0-R* on the proof instance. Fail on contradiction (R7).
- 5 Off-instance pack stays green. Then proof-instance ATs in FR section 15. Then Bob UAT.

6. Nits (do not block skeleton)

- v2/tools/parse-check.ps1 still hardcodes M:\py\agentic_fomprep and does not list the new scripts. Test-WP0 parse-checks v2 *.ps1 instead.
- Shared lib is copied into four runner trees (same pattern as formprep). Drift risk if someone edits one copy.
- Landing page grok mcp add example still uses the name priority-formprep for the catalog URL (grab-only host). Skills list is dynamic.
- Fail-closed WCF path uses reason=pin_incomplete even if a later commit sets PinComplete=true without shipping a walker. Safer than guessing; rename the reason when the walker lands.
- Amplify/DNS for mcp-priority.nts.a.uk was not redeployed or probed in this MRB. Catalog folders will show after the next host build; no MCP handler change is required.

7. What this push is not

Not a live compile of a Version Revision. Not a live install of a .sh. Not a pin of Prepare Upgrade / Install Upgrade ENAMES. Not a v1 change. Slogan still holds: **red before WCF**.
